

# Identity Management For The Enterprise

Today, the perimeter that keeps your organization secure and agile is your users' identities. It's time to take control.

Whatever it is that your business does, you need to ensure that your IT systems allow your users to work securely anywhere, on any device, and give them the access to the corporate assets they need to do their jobs.

Security based on notions of 'outside and inside', as firewalls once were, are all but useless today. Identity is the new perimeter. It will help you stay in control.

## Identity Management

A properly managed identity system in your enterprise will do so much more than just help you manage your IT and user permissions. It is now what stands between you and the people who would attack your organization. Identity management is therefore not only sensible, it is essential. It:

- is vital for security
- enables regulatory compliance, and audit reporting. You always know who's there and can monitor activities
- speeds up and automates day-to-day tasks such as provisioning, de-provisioning, reducing administration
- allows self-service user profile management, including self-service password reset (SSPR)
- enables an agile business - quickly adopt new services as technology changes
- brings together many different elements of your systems, synchronizing them for simplicity, efficiency and accuracy
- oversees and binds your IT investments whatever your infrastructure: on-premises, hybrid or cloud.

## Devices and Data

Users now expect to have all their personal and workplace content available in any combination and on any device. If you don't permit it, users will find a way anyway. To prevent a catastrophic data breach, enterprises across the world are acting swiftly to create agile and secure user environments. If you haven't already, now's the time to give users the mobility they need.

You can boost the power and flexibility of your current infrastructure by aligning and reconfiguring your IT investments with carefully selected technologies. And with identity at the heart of systems, such a unified business solution for your enterprise will:

- save you money, time and resources
- make sense of the proliferating spaghetti tangle
- offer users a seamless experience
- enable you to stay in control
- ensure corporate data and assets stay safe however they're being accessed and even if a device is lost or stolen
- and let you get a good night's sleep.

## We Have A Business Solution For You

We can work with you to create a strategy and solution with identity at the core which will give your enterprise the flexibility it needs in this new world of cloud and devices.

We have implemented hundreds of identity and enterprise mobility projects for organizations across the world. When sensitive, mission critical data is at stake we don't take any chances. Our tried and tested methodology ensures there will be no nasty surprises.

# Identity Management For The Enterprise

## The Technologies We Use

To create our identity and mobility solutions we harness the power of Microsoft Forefront Identity Manager 2010 R2 (FIM) which in 2015 became Microsoft Identity Manager (MIM). FIM/MIM is an identity and access management platform. It handles day-to-day tasks, has self-service functions for end users, and rich administrative tools for enhanced automation. Using FIM/MIM, we improve your operational efficiency and empower your users.

We are the FIM/MIM experts. We wrote the official Microsoft courses in this technology and train people all over the world. Indeed, our FIM/MIM knowledge is so deep that we can extend and customize your solution using our own portfolio of tools and components to speed up deployments, improve reporting, accelerate synchronization and much, much more.

FIM/MIM is now available as part of Microsoft's Enterprise Mobility Suite. EMS is an integrated package of Microsoft services designed to work seamlessly with one another, and can be configured to tackle most of today's business requirements: mobility, flexibility, access and security. It includes Microsoft's Azure Active Directory Premium, Windows Intune and Azure AD Rights Management Services.

**So if you're looking for a way to:**

- enable people to work securely on all devices
- simplify access and control to applications and services both on-premises and in the cloud
- offer a seamless user experience with single sign-on
- simplify management and automate services
- secure your corporate assets
- comply with data protection regulations

**we've got it.**

You'll save time, money and resources.

"You guys wrote the book on this stuff!"

## Next Steps

Engage us for a discovery workshop. Our technical and business consultants will look in detail at your current environment and business goals, and we'll discuss what's possible. After the workshop, we produce a report with suggestions, recommendations, and a customized roadmap based on your organizational aims and priorities.

## About Oxford Computer Group

Oxford Computer Group (OCG) works with organizations to create complete solutions for identity and access, cloud and enterprise mobility. We take a strategic approach that ensures all the moving parts interact seamlessly both now and in the future.

Our early adoption of and involvement in Azure AD, our deep identity heritage, and our experience of mobile device management makes OCG the "Go To" company for identity, devices, and enterprise mobility.

Since 2002 we have worked with more than 700 enterprises worldwide. We have won Microsoft's Partner of the Year Award seven times, in the categories Identity and Access, Security and Enterprise Mobility.

**No wonder businesses tell us we are the safe pair of hands they've been looking for.**
