

Microsoft Cloud Solutions

Microsoft cloud technologies enable you to build an invisible, scalable, powerful IT infrastructure to connect your workforce and empower your business.

With cloud powering your organization you can get what you need, when you need it; from advanced analytics and business apps to infrastructure and platform services, including virtual servers and storage.

Microsoft's cloud product suite includes:

Azure is Microsoft's cloud computing platform, a collection of integrated services: analytics, computing, database, mobile, networking, storage, and web.

Dynamics is a suite of customer relationship management tools to build your business through reporting and resource planning.

Intune is a mobile device, mobile app and PC management solution allowing users access to resources on the devices they choose.

Office 365 enables users to use familiar Office applications wherever they are.

With cloud you can wave goodbye to:

Security worries: not your problem anymore

Downtime: it's always on

Software upgrades: a thing of the past, it's automatic

Rooms full of hardware: machine maintainance is history!

Perimeters: your workforce can do business wherever they like

Cloud brings a refreshingly clear and clean view of the IT landscape

Azure

The Azure platform supports the broadest selection of operating systems, programming languages, frameworks, tools, databases and devices.

It integrates with your existing IT environment so whatever assets you have can stay where you need them. Azure's hybrid cloud solutions give you whatever you need: more IT options and less complexity and cost.

Azure Active Directory extends identity and access management into the cloud, enabling you to control the access governance of your new cloud applications. Similar to Windows Server AD, with Azure AD you can centrally control access to applications and resources both in the cloud and on-premises. Users get single sign-on (SSO) access to their apps, and you set policies that control who has access.

Azure AD can be used as a standalone cloud directory or as an extension to on-premises IAM. AD Premium is also available, which offers additional identity management capabilities.

Azure Rights Management Service (RMS) protect your organization's sensitive information from unauthorized access and keep you in control of how this information is used. Azure RMS allows you to enforce information protection policies without preventing your users from working effectively because the security stays with the asset.

Microsoft Cloud Solutions

Dynamics

Microsoft Dynamics is a suite of easy-to-learn and easy-to-use business solutions for growing your business through happy customers. It has a full range of software focused on delivering business insights that matter to both you and your customers including customer relationship management (CRM) software to enterprise resource planning (ERP), and from supply chain management to business intelligence and reporting.

As with all Microsoft products, you can combine it seamlessly with Office, Skype, and Yammer, to connect and collaborate instantly with your teams from any device.

Intune

Microsoft Intune is a mobile device, application and PC management solution. Employees expect access to corporate applications, data, and other resources from virtually anywhere. Intune allows this without increasing complexity for your IT department. Intune allows you to manage mobile devices including iOS and Windows on your network either through Exchange ActiveSync or directly through Intune.

Office 365

Microsoft's Office 365 (O365) enables users to use familiar, Office applications wherever they are. Its accessibility from virtually any device means your employees can stay productive in any location. You get enterprise-grade email, conferencing, and other IT services.

Deploying O365 is not always straightforward - especially if you've never done it before - and the risk of data loss and downtime prevents many organisations from migrating. A business adopting Office 365 needs its users provisioned into the cloud quickly and efficiently, yet this raises concerns around security and access rights. We can help with this.

We can help you embrace the cloud and exploit its many benefits:

- Strategy, ROI and business planning
- Platform testing
- Cloud identity management and provisioning
- Cloud access and authorization
- Entitlements management
- Governance risk and compliance support and reporting
- Training (classroom and online)
- Post-implementation support and maintenance

About Oxford Computer Group

We'll get your users access to the services they need accurately and swiftly. Our flexible and creative approach to cloud deployments has, so far, helped more than 100 organizations get into the cloud with secure access for over one million users.
